FOR UNIVERSITY RESEARCHERS · ASHA 2026 · BOOTH 2046

Help answer what real-world home practice can show.

SpeechLP logs every scored articulation practice attempt children make at home: target sound, word, timestamp and session. We're looking for university partners to validate our scoring and study home-practice dose in English.

949
profiles with practice records, Jan–Oct 2026

60,780
scored practice cards across all 24 English consonants

850+
SLPs signed up to hear from us

3x
more children practicing weekly than in July 2026

Why it matters

- **Home practice is standard but rarely measured** (Sugden et al., 2016).
- **Dose is understudied.** Frequency matters (Allen, 2013); how home trials and spacing relate to gains is open.
- **Automated scoring needs validation.** Promising in Swedish, Korean and Mandarin (Getman et al., 2022; Kim et al., 2025; Lin et al., 2024), but not yet validated for English home practice.

First look: our preprint

In 101 returning profiles, app-scored accuracy on the same sounds rose from **69.4% to 74.9%** across two consecutive 30-day periods (+5.5 pp, 95% CI 0.4 to 10.4), while practice sessions fell from 6.7 to 3.4 per child.

Descriptive and observational: no comparison group, and the app's scoring hasn't yet been checked against SLP ratings. That's the gap we want a partner to close. *Silver et al., 2026, doi:10.5281/zenodo.23932485*

Two starter studies

1. Scoring validation Could support a co-authored ASHA submission
Compare the app's correct/incorrect decisions with blinded ratings from several SLPs, acoustic measures and parent judgments, in children aged 3–12. An English replication of Getman et al. (2022). *SpeechLP doesn't store audio, so the partner records study sessions under its own IRB.*

2. Home-practice dose Uses existing data
Do the amount, spacing and accuracy of home practice predict gains? How closely do families complete SLP-assigned practice? De-identified data under a data use agreement.

What we provide

- De-identified practice data, with small cells suppressed
- App licenses for participants and engineering time for exports
- Recruitment through connected SLPs and families
- Funding can be discussed once a study is scoped

Your independence

- You lead design, ethics approval and analysis
- You can publish whatever you find, regardless of results
- We review manuscripts only for participant privacy and product facts (30 days)
- Founders' financial interest is disclosed in all outputs

Privacy: COPPA, FERPA, HIPAA and PIPEDA compliant. Audio is processed on the device and never stored; only text transcripts of what the app recognized are kept. Account and child identifiers never leave SpeechLP.

Let's find 30 minutes.
